Neuroeconomics Dataset Download Guide

Five datasets: sources, access and files to download

Updated 11 September 2026

1 Dataset download directory

Dataset	Official dataset page
NARPS Mixed-Gambles	https://openneuro.org/datasets/ds001734
Social Reward Across the Adult Lifespan	https://openneuro.org/datasets/ds005123
AgeRisk	https://openneuro.org/datasets/ds004711
Social Decision-Making in Younger and Older Adults	https://openneuro.org/datasets/ds003745
HCP Young Adult S1200	https://humanconnectome.org/study/hcp-young-adult/data-release/1200-subjects-data-release

2 How to download the four OpenNeuro datasets

Access: public datasets can be browsed and downloaded without an account. Follow the official instructions at https://docs.openneuro.org/user_guide.html.

1. Open the dataset page from the directory above. Select a published snapshot in the **Versions** menu. Record the accession, snapshot, DOI, source URL and licence.
2. Inspect the file tree. Download the README, dataset description, participant metadata and task documentation first.
3. Use the file viewer to download individual files, or the dataset's browser-download option for a complete dataset.
4. For large transfers, open the dataset's download instructions and use the provided S3, DataLad or OpenNeuro CLI route. Record the command and version; check that the route retrieves the intended snapshot.
5. Preserve source filenames and folders. Save the download log and record incomplete or unavailable files.

Download only what is required. Obtain metadata and behavioural files first. Add the selected imaging runs and any supplied derivatives separately. Do not assume that every participant has every task, run or derivative.

3 NARPS Mixed-Gambles: ds001734

Download page: <https://openneuro.org/datasets/ds001734>

Files to obtain

- Dataset README, `dataset_description.json`, participant table and available participant/task JSON dictionaries.
- Task event tables for the selected participants and runs; retain the original behavioural response records.
- Anatomical T1-weighted images and selected task BOLD files with their JSON sidecars when imaging is required.
- Required files from the supplied `derivatives/` tree; retain their documentation and any associated masks, confounds and reports available in that snapshot.

Download sequence: select the snapshot, save metadata, retrieve event files, then retrieve the matching image or derivative files using the common OpenNeuro steps. Download one participant first to confirm the intended folder selection before the larger transfer.

Completion check: compare participant/run filenames with the selected snapshot inventory. Record missing files; do not rename the source identifiers.

File-tree reference: <https://github.com/OpenNeuroDatasets/ds001734>

4 Social Reward Across the Adult Lifespan: ds005123

Download page: <https://openneuro.org/datasets/ds005123>

Files to obtain

- README, participant metadata, task descriptions and event tables.
- Original behavioural records in `sourcedata/`, with their documentation.
- Selected task-fMRI runs, all corresponding echo files and JSON sidecars; anatomical images and field maps where supplied and required.
- Diffusion data only if requested; download all accompanying diffusion metadata when selecting that component.

Download sequence: follow the common OpenNeuro steps. List the required participant/task/run combinations before starting the image transfer. Keep all echoes belonging to each selected multi-echo run together.

Completion check: use the README's missing-data notes. Some participants lack diffusion data or a second task run. Original imaging DICOM files are not released; do not treat their absence as a failed download.

File and availability reference: <https://github.com/OpenNeuroDatasets/ds005123>

5 AgeRisk: ds004711

Download page: <https://openneuro.org/datasets/ds004711>

Files to obtain

- README, dataset description, participant metadata and task JSON dictionaries.
- Balloon Analogue Risk Task event files and the corresponding task BOLD runs when imaging is required.
- Structural T1-weighted images and the JSON sidecars accompanying selected scans.
- Delay-discounting task files only if requested and present for the selected participants.
- Additional behavioural or questionnaire files from the linked OSF repository only if requested; retain its separate file inventory and retrieval record.

Download sequence: use the common OpenNeuro steps for the imaging dataset. For supplementary data, open the OSF project, inspect its Files area and download the relevant files with their documentation. Keep OpenNeuro and OSF downloads in separate source folders.

Completion check: compare selected tasks and runs with the source inventory; delay-discounting coverage is not complete for all participants.

Source documentation: <https://github.com/OpenNeuroDatasets/ds004711>

Linked supplementary repository: <https://osf.io/sh34n/>

6 Social Decision-Making and Ageing: ds003745

Download page: <https://openneuro.org/datasets/ds003745>

Files to obtain

- README, participant table, event files and task dictionaries.
- If processed data are requested, select the relevant **derivatives/** files: fMRIPrep, MRIQC, single-trial estimates and temporal signal-to-noise images, as supplied in the snapshot.
- If raw images are requested, obtain the selected task BOLD, T1/T2 anatomical images and field maps with their accompanying metadata.
- Associated task source data and scripts from the linked study repository, when needed to document the downloaded files.

Download sequence: follow the common OpenNeuro steps, selecting either the required derivatives or raw imaging package. Preserve documentation describing the single-trial image ordering.

Completion check: the README identifies sub-2xx participants as friends outside the scanner. Their missing imaging is expected, not a transfer failure.

7 HCP Young Adult S1200

Original release and documentation:

<https://humanconnectome.org/study/hcp-young-adult/data-release/1200-subjects-data-release>

Choose the release before downloading. The HCP-YA 2025 release uses ConnectomeDB powered by BALSAs and updated imaging processing. It must not be mixed with the earlier S1200 imaging release. This guide retains S1200 as the requested dataset; do not silently substitute the newer release.

Original S1200 download route

1. Start at the S1200 release page and follow its ConnectomeDB access link. Use an authorised account and accept the applicable data-use terms.
2. Save the release manual, data dictionaries and package inventory. Select participants and the required gambling-task packages and behavioural tables.
3. Follow the portal's transfer instructions. Save package names, subject IDs and release information with the downloads.
4. If the legacy service no longer supplies the requested files, record the access problem and obtain direction before switching releases.

Legacy access instructions:

<https://wiki.humanconnectome.org/docs/How%20to%20Access%20Data%20on%20ConnectomeDB.html>

Newer-release route, only if a switch is approved: open <https://balsa.wustl.edu/>, register or sign in, select the ConnectomeDB tab, accept the HCP-Young Adult 2025 terms, then filter subjects and queue the required files. Save documentation from the Files tab. Restricted-data access requires separate authorisation.

Official release-change notice:

<https://www.humanconnectome.org/study/hcp-young-adult/article/updated-hcp-young-adult-data-released-connectomedb-powered-balsa>

Files to request and retain

- Release-specific manual, package descriptions and unrestricted data dictionary.
- Unrestricted participant and behavioural tables with the fields needed to identify the selected subjects and task availability.
- Gambling-task event files and selected processed task images or result packages; retain LR/RL run identifiers where supplied.
- Structural or other imaging packages only when explicitly requested.
- Restricted tables only after approval; store them separately and do not redistribute them with public downloads.

8 Download folders and completion checks

Use one folder per dataset and release. Preserve the downloaded source tree inside each folder; keep externally supplied processed files separate from raw files.

```
downloads/
  ds001734/<snapshot>/
  ds005123/<snapshot>/
  ds004711/<snapshot>/
  ds003745/<snapshot>/
  hcp_s1200/<package>/
  metadata/
    source_manifest.csv
    file_inventory.csv
    checksums.sha256
    download_log.txt
```

Record for every download

Record	What to save
Source	Dataset name, accession, DOI where supplied, source URL and exact snapshot/release
Access	Licence or data-use terms; approval status for controlled files
Transfer	Retrieval date, download method, command or package selection, completion status; omit passwords and tokens
Inventory	Relative filename, file size, participant/task/run identifiers where applicable
Integrity	SHA-256 checksum and comparison with provider checksums when available
Exceptions	Failed transfers, missing source files and any retry outcome

Before marking the download complete

1. Match the downloaded file list to the intended snapshot and selected package inventory.
2. Check that downloaded archives open and that no transfer is partial or unexpectedly empty.
3. Keep metadata, event tables and sidecar files alongside their matching images. Record expected source omissions separately from failed transfers.
4. Verify provider checksums where supplied, and retain local checksums for later integrity checks. A local hash alone does not prove agreement with the source.
5. Preserve the original filenames, folder structure and unedited data; retain the source's BIDS validation report when available.
6. Confirm that restricted files and credentials are excluded from any shareable download bundle.

Download handover: source files, documentation, source manifest, inventory, checksums and transfer log. No modelling, feature construction, cross-dataset harmonisation or publication deliverables are required by this guide.
